Keynote Speakers

Precision Agriculture, Food Security and Geostatistics

Dr. Margaret Oliver

Margaret Oliver did her first degree in Geography and Geology in the UK at the University of Bristol, followed by a PhD in soil science at the University of Birmingham. The early research focused on the multivariate and geostatistical analysis of soil data from the Wyre Forest. Since then her research interests have included the application of a wide range of numerical methods to soil and

other data including pollen counts, forestry, radon emission, remotely sensed imagery and the incidence of childhood cancer. Specific interests are in sample design for spatial analysis and eventual mapping, risk analysis associated with prescribed thresholds in relation to soil pollutants or deficiencies of soil nutrients, and the relations between different scales of spatial variation. Most recent research has been in the field of precision agriculture.

Margaret retired at the end of September 2004 from her post as Reader in Spatial Analysis at the University of Reading. She has retained a link and a base at the University as a Visiting Professor since January 2005. She has published over 100 academic papers and has also made contributions to books. She is co-author of two books and has edited two books - *Geostatistical Applications for Precision Agriculture* and *Precision Agriculture for Sustainability and Environmental Protection*.

She is Deputy Editor of the *European Journal of Soil Science* (2011–present) and was Co-Editor of *Precision Agriculture* with John Stafford for six years until the end of 2010, but remains on the Editorial Board.

Plant Specific Agriculture, Engineering Technologies for Crop Mapping, Proximal Sensing, and Management at the Centimeter Scale

Dr. David Slaughter

David Slaughter is a professor in the Biological and Agricultural Engineering Department and director of the Biological and Agricultural Engineering Sensors and Instrumentation Laboratory (BAESIL) at the University of California, Davis. He received his Ph.D. degree (1987) at the University of Florida, his M.Sc. degree (1984) at North Carolina State University, and his B.Sc. degree (1982) at

the University of California, Davis. Dr. Slaughter is a world leader in the development of non-destructive and non-invasive sensing systems for determining the quality, characteristics and identity of agricultural commodities and an expert in mechatronic systems for precision agriculture. He has six ASABE paper awards and he holds six US patents related to innovations he developed in these topic areas. He was a pioneer in the development of one of the first robotic fruit harvesting systems and holds the USA patent on the concept of the robotic cultivator. He developed one of the first machine-vision based automatic guidance systems for precision inter-row weed control and for automated spray bandwidth control in row crops. He has developed, not one, but three technologies (based upon: machine vision, x-ray, and RTK-GPS) for automated, pesticide-free, intra-row weed control in specialty crops. He has developed a robust, on-farm system for plant species determination in tomato and lettuce. Moreover, he co-developed 1-cm scale pulsed-jet micro-dosing technology for applying liquid materials onto individual plant leaves and applied this technology to create an automated system for thermal micro-dosing of lethal non-pesticide treatments to control intra-row weeds in organic production systems. Dr. Slaughter's outstanding work in the area of non-destructive and non-invasive sensing systems for determining important characteristics of agricultural commodities has led to the development of fundamental knowledge, practical methodology and reduction to practice of many nondestructive and noninvasive sensing techniques for the rapid determination of internal quality in agricultural commodities.
